Kiwi, kiwi and Kiwis

The bird. Five species, none of which can fly; they are mostly active at night. The only bird with nostrils at the tip of its beak: it sniffs out worms underground. Its egg weighs up to a fifth of the mother. About 70,000 are left, and unprotected populations shrink about 2% a year.

The fruit. It began as the "Chinese gooseberry": teacher Isabel Fraser brought the seeds from China in 1904, and the vines first fruited in Whanganui in 1910. In 1959 Turners and Growers renamed it "kiwifruit" to sell it in the United States. About 80% of the crop grows in Bay of Plenty, and Te Puke calls itself the kiwifruit capital of the world.

The people. By 1917 New Zealand soldiers in the First World War were being called "Kiwis"; after the Second World War the name spread to all New Zealanders.

Drawings after J. G. Keulemans, North-Island kiwi, in W. L. Buller, A History of the Birds of New Zealand (1888), public domain; and a photo by André Karwath, CC BY-SA 2.5.
